Task 2: Read the text and choose True or False.

What is a computer?

A computer is a machine that helps us complete tasks quickly and accurately. People use computers for many purposes: writing emails, creating presentations, playing games, and finding information. Computers are essential in schools, offices, and homes worldwide.
The main parts of a computer are the monitor, keyboard, mouse, and CPU (Central Processing Unit). The monitor displays images and text, the keyboard allows us to type, and the mouse helps us click and select things on the screen. The CPU, sometimes called the "brain" of the computer, processes information and makes everything work.
There are also different types of computers. Laptops are portable and can be used anywhere, while desktops are larger and often used in offices or at home. Tablets and smartphones are also computers but are smaller and often use touchscreens instead of keyboards and mice.
With the internet, computers connect us to people and information worldwide. We can research school projects, watch videos, and even talk to friends who live far away. Computers have become a big part of our daily lives and continue to improve and change.

1. People only use computers for playing games.
2. The monitor is used to type letters and numbers.
3. The CPU is sometimes called the "brain" of the computer.
4. Laptops are portable and can be used anywhere.
5. Smartphones and tablets are types of computers.
6. Computers help people connect with others around the world.
7. Desktops are smaller than laptops and easy to carry.
8. The internet allows computers to access information globally.
