Landslides

Landslide or often referred to as ground movement is a geological event that occurs because of the movement of rock or soil with various types and types such as falling rocks or large lumps of soil. In general, landslide events are caused by two factors, namely driving factors and triggering factors. The driving factors are the factors that influence the material condition itself, while the trigger factors are the factors that cause the material to move.

Although the main cause of this event is gravity which affects a steep slope, but there are also other factors that influence, including erosion, slopes from rocks and soil that are weakened through saturation caused by heavy rainfall, and volcanoes that create deposits of dust that quiet, heavy rain and flow of dust.

There are many things that can be done to prevent landslides, such as not making a pond or rice field on a slope, not building a house under a cliff, not cutting down trees around the slope, do not cut the cliff perpendicular, and not erecting buildings

LIVEWORKSHEETS

XI

1. What does the structure of the text above? General statement, sequenced explanation, general classification, description
2. What is the other word of "influence"? affect, caused

DROP DOWN

1. What is the text talk about?
   a. Earthquake
   b. Volcanos
   c. Landslides

2. What can we conclude from the text above?
   a. Do not play the water frequently
   b. Take care of nature
   c. Always be care full in anytime

MULTIPLE CHOICE
