A Polar Molecule

I am a molecule that can attract and repel other molecules	I am a molecule that only contains a negative charge.	I am a molecule that only contains a positive charge.
I am a molecule with a positive and negative charge.	An example of myself is water	I can behave well as a solvent e.g. water
I can form hydrogen bonds with other polar molecules	I do not have any charges.	I cannot bond with other molecules that have charges.
