Saving Our Planet from Climate Change

Climate change is a big problem for our Earth. It's making things harder for plants and animals to live. We've known about this for some time now, and it's causing troubles for farmers, our water, and how we get around.

Some of the reasons for this are natural, like when volcanoes erupt or when the sun's heat changes. But a big part of the problem is because of what people are doing. Cutting down trees and throwing away waste from factories are making things worse.

This is causing a lot of bad things to happen, like the sea getting higher, ice melting, more bad air, and fewer forests and animals. If we don't do something about it, many kinds of animals might disappear forever, and our Earth will get hurt a lot.

But there's still hope. If we all work together, we can fix the things we did wrong before. We can make things better and make sure our Earth stays nice for everyone.

Decide the following statements TRUE or FALSE.

1.	Trees are being cut down by humans, contributing to the problem of climate change.	_____
2.	If we don't change our ways, all types of animals will continue to thrive on our planet.	_____
3.	Farmers, water sources and transportation are being affected by climate change.	_____
4.	It's too late to correct our mistakes and make the situation on Earth better.	_____
