# LAYERS OF THE RAINFOREST

1. **Link each dot to its corresponding layer name**
2. **Mark the square with a tick if the description is accurate**

## Forest Floor

☐ This layer is dark and humid, covered with a layer of decomposing plant and animal matter.

## Canopy

☐ This layer is characterized by small trees, shrubs, and herbaceous plants that thrive in the filtered sunlight that reaches the forest floor.

## Emergent Layer

☐ This layer consists of the tallest trees that rise above the general canopy, often reaching heights of 100 feet or more

## Understory

☐ This layer is formed by the crowns of mature trees, creating a continuous layer of leaves and branches.
