THE MODELLING OF THE EARTH'S RELIEF

Complete the text with this words:

Dynamic factors	internal processes	agent	anthropic	chemical weathering
Parent rock	meanders	deltas	abrasion platforms	chemical action

1. This biotic process, _____, is caused by micro-organisms like bacteria and fungi. They decompose organic matter and release products which form part of the soil.
2. These factors, _____, are related to the process of building the landscape.
3. An external _____ is a material body which is able to produce changes in geological materials as result of the action of energy.
4. These type of curves or _____ are very common in the middle curse of a river.
5. The _____ is the original geological matter over which soils are formed.
6. The _____ of a rock takes place when the atmospheric agents of the hydrosphere or biosphere act on the rocks and transform the minerals which make them up.
7. The _____ are brought about basically by the internal energy stored in the Earth's interior.
8. _____ are accumulations of sediments that appear in some rivers estuaries if the deposits occur in shallow, calm waters.
9. _____ processes are the ones got as result of the human activity.
10. _____ are flat rocky surfaces which are slightly sloping towards the sea.
