Cells are the building blocks of life all living things are made up of cells: plants, insect, animals and people.

The cell is the smallest unit of life. The cell performs jobs that keep organisms alive. The cell has certain parts that perform certain jobs. The Nucleus is the brain of the cell and controls all the functions of the cell. The membrane controls what comes in and out of the cell. The Cytoplasm controls the elements the cell needs to function. The Mitochondria produces energy for the cell. What part is only found in plant cells, the Chloroplast, it transforms light into energy.
