A peninsula is an interesting land formation that juts out from a larger tract of land and into the nearby water. Almost an island but not quite, the water, be it sea, ocean, or river, surrounds the jutting land on 3 sides.

Whether large or small, wide or narrow, peninsulas are **unique** geographic locations. Every continent in the world has a peninsula that was formed by rising or falling sea levels. These land formations often host wide ranges of **flora and fauna**, many of which are threatened or endangered. Due to their unique geographic positioning, peninsular lands are often important in international trade.

- What is the largest peninsula in the world?
- What is the definition of the word 'unique'?
- What do you understand by the words 'flora and fauna'?
- What is the name of the flower on the right?
- And the bird?
