MATERI 1 – TEXT REPORT

TUGAS 1-TINGKAT MAHIR

At the end of the lesson, you will be able to explain various kinds of information about the organisms living in the soil

TEXT 2.

BACALAH TEXT BERIKUT DAN JAWAB PERTANYAANNYA!

Fungi

Fungi (singular fungus) are among the most widely distributed organisms on Earth and are of great environmental and medical importance. Many fungi are free-living in soil or water. Other fungi form parasitic or symbiotic relationships with plants or animals.

Fungi are eukaryotic organisms. This means that their cells contain membrane bound organelles and clearly defined nuclei. Historically, fungi were included in the plant kingdom. However, because fungi lack chlorophyll, they have been separated from plants. In addition, fungi are clearly distinguished from all other living organisms, including animals.

A typical fungus consists of a mass of branched, tubular filaments enclosed by a rigid cell wall. The filaments, called hyphae (singular hypha), branch repeatedly into a complicated, radially expanding network called the mycelium, which makes up the thallus, or undifferentiated body, of the typical fungus.
