

The chemical makeup of the alien planet's oceans seems to be about the same as the Earth's oceans. When sea water is distilled, the liquid is boiled off. This liquid was shown to consist of two atoms of **Pfsst (Pf)** and one atom of **Nuutye (Nu)**, (**Pf₂Nu**). The solid left behind after the distillation consists mainly of a crystal made of the elements **Byyou (By)** and **Kratt (Kt)**. (**ByKt**)

Of these alkali metals, **Chow (Ch)** has the lowest atomic mass. **Quackzil (Q)** is in the same period as Wobble (W).

Floxxit (Fx) is found in all living things and forms a black crystal that has 4 electrons in its outermost energy level. Both **Rhaatrap (R)** and **Doadeer (Do)** have atoms with four energy levels, but Rhaatrap (R) is less metallic than **Doadeer (Do)**. **Fx R Do**
