GRAMMAR REVIEW UNIT 1

IV - Read. Circle T (True) and F (False).

Starfish

There are over 2,000 species of starfish in all the seas. Most of these are in shallow water, but a few do live in the deep seas. The body of a starfish has five arms and a toothless mouth. The number of arms and size may not be the same, from species to species. Different species of starfish have different colors like pink, orange, yellow, blue, gray, green or purple.

A starfish can easily grow back an arm or two if it has lost them. Starfish eat fish, worms, etc. There is one species that eats coral polyps. The female starfish lays millions of eggs into the sea. From the egg and from the larva, in about two months, a young starfish will break free. We can find starfish on most beaches. These starfish are usually dead or dying. They are widely used in decorations.
