Match the type of fossil with the correct description and picture.

Mineralization 	When sediments hardened around buried trilobite, a mold forms. It usually shows hard parts such as shells or bone.
Carbonization 	Rock forming minerals such as calcium carbonate, in water filled in the small spaces in the tissue of these pieces of petrified wood.
Molds and casts 	Tissue of organisms buried without oxygen for long periods of time that fossilize.
Trace fossils 	Pressure drives off a dead organism's liquids and gasses. Only the carbon outline of the organism remains.
Original material 	A fossil that has preserved evidence of the activity of an organism.
