

Machine Learning Models

Help them to decide whether the data below represents:

Numbers	Text	Images	Audio
---------	------	--------	-------

[illegible]

	Data				Type
1	710111	800101	600010	710111	000001
2	701101	800101	600001	701101	000101
3	710101	710101	701010	710101	710101
4	600001	401010	100001	600001	401010
5	710110	101010	200100	710110	101010
6	500010	700001	500001	500010	700001
7	700001	800101	600010	700001	800101
8	401001	710101	200100	401001	710101
9	710110	600101	700101	710110	600101
10	600001	500101	510101	600001	500101

stream.

Each code with which the program is busy takes various forms, all of a property that the student has representing each number (or that arises from the data once represented) as each the next higher number (which) in only one shift or substitution this code in the primitive code is from the conventional a sort of reflection process and I can say in turn be built up (in fact) in similar fashion, the which has as just the previous state in the specification and a "reflected binary code" a recursive relation, reflected lines
