

TEACHER'S NAME:

NAME:

CLASS:

8.1 LOCUS

1. State the locus of point P of each of the following.

Drag the choices of answers and put in the spaces provided

An Arc

A circle

An inclined straight line

A vertical straight line

A horizontal straight line

8.2 LOCI IN TWO DIMENSIONS

2. Match the following.

The locus of a point that is equidistance from two fixed points, P and Q

The angle bisector of $\angle QPR$

The locus of a point with a constant distance from a straight line PQ

The perpendicular bisector of the straight line PQ

The locus of a point that is equidistant from two intersecting lines

Two parallel lines that are equidistant from the straight line PQ

The locus of a point with a constant distance from a fixed point P

A line that is parallel and equidistant from two parallel lines, PQ and RS

The locus of a point that is equidistant from two parallel lines, PQ and RS

A circle with centre P

3. Determine the locus of the point which satisfy the given condition.

A point Q moves such that it is always equidistant from two intersecting lines.

Answer : The bisector of the angle

TRUE

or

FALSE

4. Match the following locus of point X.

A point X which moves such that it is always 3 cm from point P.

KL is a straight line. X is a point which moves such that it is always 2 cm from point L.

PQR is an isosceles triangle with $PQ = PR$.

X is a point which moves in the triangle such that $XP = PS$.

ABCD is a square drawn on a grid of equal squares with sides of 1 unit. X is a point which moves in the square such that it is always 6 units from point C.

5. Match the following locus of point Y.

A point Y which moves such that it is always equidistant from point P and point Q.

EFG is a triangle. Y is a point which moves such that it is always equidistant from the point F and point G.

PQRS is a rectangle. Y is a point which moves in the rectangle such that $YR = YS$

AEJH, EBFG, HJGD dan JFCG are four squares. Y is a point which moves in the squares such that it is always equidistant from point A and point C.

6. Match the following locus of point R.

A point R which moves such that it is always equidistant from two parallel lines, KL and MN.

A point R which moves such that it is always equidistant from two parallel lines, PQ and ST.

TUVW is a parallelogram drawn on a grid of equal squares with sides of 1 unit. R is a point which moves in the parallelogram such that it is always equidistant from line TW and line UV.

ABCD is a square. R is a point which moves in the square such that it is always equidistant from line AD and line BC.
