Quiz 2: Reading Comprehension Porcentage: 10%

"I woke up about a minute later and my mom told me I had been struck by lightning."

—*Geoff Banninger*

On a sunny afternoon in 2004, nine-year-old Geoff Banninger was walking to a park in Colorado to see his sister play softball. But before he got to the park, Geoff was struck[1] by lightning.

The lightning stopped Geoff's heart and his breathing. It burned his hair and left a burn line from his head to his foot. It blew his glasses off his face and melted[2] them. It even made a hole in the bottom of his shoe. "I woke up about a minute later," says Geoff, "and my mom told me I had been struck by lightning."

What is lightning? A lightning strike is the result of a buildup of electrical charges[3] inside a cloud. We usually see lightning during stormy weather. But, as Geoff discovered, it can happen even on a sunny day.

Geoff's legs felt strange after he was hit, but he hasn't had any further problems since then. "I'm a lucky guy," he says. But being lucky is not the only way to ensure your safety during a thunderstorm. You can also follow the 30/30 rule: if you see lightning, and then hear thunder less than 30 seconds later, go inside a building. Then wait 30 minutes after the last thunder or lightning before you go back outside.

So how likely is it you will be hit by lightning? Fortunately,[4] it's not a common problem. According to the U.S. National Weather Service, your chance of being struck in your lifetime is only 1 in 5,000.

[1] If you are **struck** by something, it means you have been hit by it.
[2] When something **melts**, it changes from solid to liquid, usually because it has been heated.
[3] An electrical **charge** is an amount of electricity that is held in or carried by something.
[4] If someone or something is **fortunate**, they are lucky.
