... can help doctors detect problems.

a) _____
b) _____
c) _____
d) _____
e) _____

LIVEWORKSHEETS

Match:

a) Caesarean section

b) Ultrasound scan

c) In-vitro fertilisation

d) Amniocentesis

1. problems having babies
2. analysis of amniotic fluid to detect abnormalities
3. breech birth
4. check the development of the fetus

LIVEWORKSHEETS

Select the correct option:

Sometimes, people find it hard to have babies.

In-vitro fertilisation / Amniocentesis is a procedure that involves joining the male and female reproductive cells outside the woman's body, in a computer / laboratory . If fertilisation / pollination occurs, the zygote is placed inside the woman's uterus / stomach . There it can then grow and develop into a fetus.

Problems can occur during birth.

One of these problems is a breech birth / section . In these cases, doctors usually perform a Caesarean birth / section . They cut a small opening through the lower abdomen and the wall of the uterus / vagina . The fetus is extracted through this opening, instead of through the mother's vagina.

LIVEWORKSHEETS

Are these sentences TRUE or FALSE? Correct the false ones:

In in-vitro fertilisation, the fetus grows in a laboratory until its birth.

_____

A Caesarean section is often used during breech births.

_____

An ultrasound scan is sometimes painful for the mother and the fetus.

_____
