

OUR SEVEN CONTINENTS

The seven continents are the seven main land areas on the Earth. Some are joined to each other, and some are surrounded by water. Some continents have a lot of countries but others have only a few. Earth's seven continents are Asia, Africa, North America, South America, Antarctica, Europe, and Australia. It is believed that in past that all continents were joined together. This land area was called Pangaea. This area started to break up and got divided into 7 parts.

Asia is the largest continent. Half of the world population lives here. The world's two most populous countries are China and India is in this continent. Africa is the second largest continent. The longest river in the world is here and it is called the Nile. It is also the home of the Sahara, the largest desert in the world. Australia is the largest island and it is also the smallest continent in the world. It is also known as "island continent".

In Europe, there are no deserts. It is the only continent without any deserts. Most of the countries of Europe use a single currency called the Euro. North America is the only continent that has every kind of climate. North America is around twice the size of Europe. South America has the world's largest river, Amazon River. It is also the home of anaconda, one of the world's largest snakes. Brazil, a country in South America, is the largest producer of coffee in the world. Soccer is the most famous game in this continent.

Antarctica is a frozen land area around the South Pole. It is also called "Frozen Continent". This continent is the highest, driest, windiest, emptiest, coldest place on earth. The water of the Antarctica is so cold that nothing can rot here.
