Subject: Interdisciplinary Unit

Topic: Animal Adaptations

Adaptations are characteristics of an animal that help it to survive in its environment.

Animal's body parts help them to meet their needs. The shape of a bird's beak helps it to eat certain types of food. A bird's feathers and a mammal's **fur** help them to keep warm.

Some mammals have sharp hairs or whiskers for protection.

Scales on a fish help protect the fish from disease and from other animals in the water. A reptile's scales protect it from injury and from drying out. The overlapping scales on snakes helps a snake to move.
