

LA FRASE NOMINAL

1. Leer el siguiente fragmento y:

- a. Traducir las frases nominales resaltadas.
- b. Escribir las traducciones en el cuadro adjunto.

The grape berry¹ is an independent biochemical factory² that contains water, sugar, amino acids, minerals, and micronutrients. The synthesis of other components like flavor and aroma compounds occurs in the berry as well. There can be a great deal of variability between berries within a cluster, between clusters within a vine, and between vines within a vineyard. The determination of berry ripeness³ can be difficult due to this variability. The main objective of the grower⁴ is to achieve a uniformly ripe crop⁵ with great flavor and aroma compounds.

The berry itself⁶ has three main tissues that comprise it: flesh, skin, and seed. Each tissue contributes differently to overall wine composition. This composition⁷ can be manipulated by changing berry size, but other factors such as the number of seeds, environment⁷, and nutrition can also affect final wine quality⁸. However, every one of these components is tied initially to successful flower fertilization. For the grape vine, reproduction⁹ is the number one purpose of its existence. Humans¹⁰ manipulate this process for their benefit.
