"Smoking during pregnancy"

Smoking during pregnancy is bad for babies. When a woman smokes she inhales over 4,000 chemicals from the cigarette. One of these is a dangerous chemical called carbon monoxide (CO₂), which gets into her bloodstream and replaces some of the oxygen in her blood. This means that the baby can not get enough oxygen which is essential for its healthy growth and development, and because cigarettes restrict their oxygen supply, their hearts have to beat harder every time the mother smokes.

Smoking can also cause a greater risk of miscarriage and stillbirth (death inside the womb). Besides, the baby is might be born prematurely and with a low birth weight. Children of smokers may also get ear infections, asthma, learning disorders and behavioral problems and chest infections. They could also become smokers as they get older.

Adapted from (www.smokefree.nhs.uk)

- a. A smoker inhales only 4,000 chemicals when she smokes _____
- b. CO₂ replaces all oxygen in blood. _____
- c. When a pregnant woman smokes, she forces the baby's heart to work harder
