

Exercise 9

Look at the words in bold in the second part of the article. Are they used in a positive or negative way? Complete the table with the words in the box. The first one has been done for you.

F The failings of modernist architecture are well documented, and many writers and theorists have made a living out of critiquing it. But the high point of this trend was the **delight** that many shared over the demolition of the **disastrous** Pruitt-Igoe urban housing complex in St Louis in the USA. It had been designed by architects George Hellmuth, Minoru Yamasaki and Joseph Leinweber, supposedly to create 'community gathering spaces and safe, enclosed play yards'. And yet for some reason, the community declined to gather and play safely in their enclosed yards. Instead, the complex became a **hotspot** for crime and poverty and was demolished in the 1970s.

G As with many of the modernist planning and design philosophies of the twentieth century, architectural determinism was **appealing** at first sight but ultimately **misguided**. It became unfashionable during the post-modern era and all but disappeared. One of the consequences of this loss of faith in the power of architecture is that architects are now left **defenceless** before the superior technical know-how of structural engineers, the restrictions placed on them by generations of planners and the calculations of project managers.

H But was architectural determinism dismissed too soon? This is one question posed by Jan Golembiewski, a researcher in the environmental determinants of mental health at the University of Sydney and a consultant for Medical Architecture, a firm specialising in architectural psychology. Golembiewski's research has found that the healthier a person is, the more a well-designed environment will affect them positively, and the less a badly designed one will affect them negatively. Patients who are mentally ill react more negatively to bad environments, which means 'fewer smiles, less laughter and a reported drop in feeling the fun of life'.

I Likewise, Charles Montgomery, author of *Happy City: Transforming our Lives Through Urban Design*, points out that some environments do affect our moods, and that they do so rather predictably. His central thesis is that urban **sprawl** – the unplanned spread of car-dependent, low-density development that accounts for most new housing in many parts of the world – makes us

unhappy and **isolated** and drives teenagers to boredom. The **drawbacks** of urban sprawl aren't confined to psychological health; living amongst sprawl ages people by an extra four years, and there are four times as many fatal traffic accidents on suburban roads as on city streets, according to Montgomery's research.

J Many **progressive** measures were implemented by Enrique Peñalosa during his tenure as mayor of Bogota in Colombia from 1998 to 2000. Bogota, now a city of 8 million people, had no underground rail system at that time and suffered from **chronic** congestion. Peñalosa's city model gave priority to children and people not using vehicles. He built hundreds of kilometres of cycle paths, pavements and parks, and set up traffic-free zones. He organised a car-free day in 2000 (now an annual event), took measures to address poverty and started a programme of urban improvement, with more than 100,000 trees being planted across the city. All of these are impressive **accomplishments** in themselves, but his most **compelling** legacy has to be the way that he transformed people's view of Bogota. Whereas previously, the city's troubles had been seen as an inevitable consequence of **uncontrolled** urban growth, people now began to see that they could influence change in Bogota for the better.

K Clearly, there is now a resurgence in the belief that the built environment is a key factor in how we feel, and that buildings are central to influencing behaviour. Many of the journals adopting this stance, such as *World Health Design* and *Environment and Behaviour*, focus primarily on the design of healthcare facilities, as this is where quality design can potentially have life-and-death consequences. Schools of architecture need to focus on how their students might predict how their designs can impact the users of the buildings, and give thought to including **calming** areas and spaces, such as gardens, in order to affect our moods, behaviours and health in as positive a way as possible.

drawbacks (Paragraph I)	uncontrolled (Paragraph J)	appealing (Paragraph G)
calming (Paragraph K)	isolated (Paragraph I)	sprawl (Paragraph I)
misguided (Paragraph G)	chronic (Paragraph J)	hotspot (Paragraph F)
progressive (Paragraph J)	disastrous (Paragraph F)	compelling (Paragraph J)
accomplishments (Paragraph J)	defenceless (Paragraph G)	

positive meaning	negative meaning
delight (Paragraph F)
