Each year, the Academy Awards, better known as the “Oscars”, celebrate the best films and documentaries with categories ranging from acting, directing and screenwriting, to costumes and special effects. This year, 9-year-old Quvenzhané Wallis joins the list of kids who have taken the movie business by storm, as she competes for the best actress award for her role as “Hushpuppy” in the film “Beasts of the Southern Wild”.

The Academy of Motion Picture Arts and Sciences is made up of filmmakers in all fields. The group ranks their favourites in each category. Oftentimes Oscar recognition can take many years, but for some lucky and talented individuals that honour comes early in life.

Newcomer Quvenzhané Wallis (pronounced Kwe-VEN-zhah-nay) portrayed “Hushpuppy,” a young girl fighting to survive in a poor Mississippi Delta community prone to devastating flooding. In the film, Wallis learns to find food in the wilderness, escapes a homeless shelter and deals with the death of her father. She will be the youngest ever nominee in the best actress category at nine years old.

Born in Houma, LA., Quvenzhané was just five years old when she auditioned for Beasts of the Southern Wild. Since auditions for the role of Hushpuppy were only open to 6-9-year olds, Quvenzhané’s mother lied on the initial paperwork to allow her daughter to audition. When director Benh Zeitlin saw her audition however, he immediately recognized her as the best pick for this strong and independent young character.

Read the following passage and mark the letter A, B, C, or D on your answer sheet to indicate the correct answer to each of the questions from 36 to 42.

Hydrogen is the most common element in the universe and was perhaps the first to form. It is among the ten most common elements on Earth as well and one of the most useful for industrial purposes. Under normal conditions of temperature, hydrogen is a gas. Designated as H, hydrogen is the first element in the periodic table because it contains only one proton. Hydrogen can combine with a large number of other elements, forming more compounds than any of the others. Pure hydrogen seldom occurs naturally, but it exists in most organic compounds, that is, compounds that contain carbon, which account for a very large number of compounds. Moreover, hydrogen is found in inorganic compounds. For example, when hydrogen burns in the presence of oxygen, it forms water.

The lightest and simplest of the elements, hydrogen has several properties that make it valuable for many industries. It releases more heat per unit of weight than any other fuel. In rocket engines, tons of hydrogen and oxygen are burned, and hydrogen is used with oxygen for welding torches that produce temperatures as high as 4,000 degrees F and can be used in cutting steel. Fuel cells to generate electricity operate on hydrogen and oxygen.

Hydrogen also serves to prevent metals from tarnishing during heat treatments by removing the oxygen from them. Although it would be difficult to remove the oxygen by itself, hydrogen readily combines with oxygen to form water, which can be heated to steam and easily removed. Furthermore, hydrogen is one of the coolest refrigerants. It does not become a liquid until it reaches temperatures of -425 degrees F. Pure hydrogen gas is used in large electric generators to cool the coils.

Future uses of hydrogen include fuel for cars, boats, planes, and other forms of transportation that currently require petroleum products. These fuels would be lighter, a distinct advantage in the aerospace industry, and they would also be cleaner, thereby reducing pollution in the atmosphere.

Hydrogen is also useful in the food industry for a process known as hydrogenation. Products such as margarine and cooking oils are changed from liquids to semisolids by combining hydrogen with their molecules. Soap manufacturers also use hydrogen for this purpose. In addition, in the chemical industry, hydrogen is used to produce ammonia, gasoline, methyl alcohol, and many other important products.
