Dear Smithsonian Magazine,

Apartment 17 B  
Harbor Heights  
Hong Kong

In addition, I would like to say that it changed the way humans transport from one place to another, not only themselves but also different goods, animals, etc. The wheel helped nomads to move and settled down wherever they needed to.

Another great use of the wheel is in technology, mechanic and engineering.

In conclusion, this is the foundation for human kind to move on and develop our intelligence in a way we sometimes don't realize.

Thanks a lot for this article, it helped me a lot and I learnt different facts I did not know before.

I recently read "A Salute to the Wheel" in your website. I am writing this letter to express my opinion about this device that has revolutionized the world history.

First of all, I have read that there are evidences indicate they were created to serve as potter's wheels around 3500 B.C. in Mesopotamia—300 years before someone figured out to use them for chariots. But, there is not a specific inventor, because different civilizations worldwide and in different moments of history.

Something that really surprised me is the fact that it is nature human invention, it means that there is nowhere in our environment that could inspired this creation.
