D. Read about seals. Write complete answers to the questions.

	Seals are mammals (A). There are 18 species of seals in the world. They live around the coasts around Australia, East Asia, and America (B). Six types of seals live in the Antarctic (C). Crabeater seals live in the Antarctic. They have the biggest number of seals. They do not eat crabs. They eat krill, which are very small crustaceans (D). They have special teeth for catching krill (E). They have gray or brown fur, they are thinner than most other seals and their snout is pointed. They can jump out of the water. They can stretch their necks to look around in the water. They live in big groups. More than 1.000 crabeater seals can sit together on land and more than 200 can swim together in the water. They have pups from September to December. The pups are brown or light brown.
