

EXCRETORY SYSTEM

Expels waste from the body.

The **URINARY SYSTEM** is responsible for removing liquid waste from our body.

The **KIDNEYS** filter the blood and separate the waste and water.

Water and waste forms **URINE**

The **URINE** goes down two tubes called **URETERS** to the **BLADDER**.

When the **BLADDER** is full, you must go to the bathroom.

The **BLADDER** releases **URINE** through the **URETHRA**.

SWEAT is a mixture of water and minerals.

When your body is too hot, **SWEAT GLANDS** produce **SWEAT**.
