New gardeners are planted carefully.

Under Attack

Many animals spend most of their lives protecting their young from predators. Some animals, like the cheetah, are born with spots that help them hide. Other animals, like the kangaroo, have pouches where they can keep their young safe. Some animals, like the octopus, can change color to blend in with their surroundings. All animals have ways to protect their young from predators.

Glossary...

There are three types of communities. You might need to decide when you get older which type of community you would like to live in. These three types of communities are referred to as rural, suburban and urban and each of these is very different from the others.

Adapt - adjust to a condition or environment.
Survive - an animal that survives.
Climate - weather conditions of an area, including average temperature and rainfall.
Adaptation - the way a living organism survives in its environment.
Predator - an animal that hunts and kills other animals for food.
