

# Find the Definition

CPU

also called mainboard, main circuit board, system board, baseboard, planar board, logic board, and mobo) is the main printed circuit board (PCB) in general-purpose computers and other expandable systems.

GPU

is required to remove the waste heat produced by computer components, to keep components within permissible operating temperature limits.

RAM

is an electro-mechanical data storage device that stores and retrieves digital data using magnetic storage and one or more rigid rapidly rotating platters coated with magnetic material.

Hard Drive

is a specialized, electronic circuit designed to rapidly manipulate and alter memory to accelerate the creation of images in a frame buffer intended for output to a display device.

Cooler

is a form of computer memory that can be read and changed in any order, typically used to store working data and machine code.

Power Supply

is an electrical device that supplies electric power to an electrical load. The primary function of a power supply is to convert electric current from a source to the correct voltage, current, and frequency to power the load

Motherboard

also called a central processor, main processor or just processor, is the electronic circuitry within a computer that executes instructions that make up a computer program.
