

Summary Making

In FOUR sentences of your own, summarize the paragraph in an answer to the following question: How can we reduce water consumption?

There are numerous ways in which people can save water. If you're in the process of brushing your teeth or scrubbing your face, turn the water off. Turn it back on only when you're ready to rinse. Limit the length of your showers and baths. The garbage disposal is a huge source of water waste because water must remain running as the disposal breaks down food. Instead, you could throw extra scraps away, give them to pets or even create a compost pile for a garden. Water pipes that are not insulated waste significantly more water because it takes them longer to heat up. By insulating pipes, water will be able to heat quicker, thereby reducing the amount of undesired cool water that snakes down the drain before your hot water appears. There are numerous water-saving alternatives to traditional appliances. Low-flow faucets, low-flush toilets and flow-regulating shower heads are ideal. They help users save water, while having very little impact on these daily activities.
