

ARTHROPODS

Arthropods are the largest invertebrate group. There are **four smaller groups** of arthropods:

- exoskeleton
- eight legs
- most have eight eyes

- exoskeleton (an external skeleton)
- six legs
- two antennae
- most have wings

Write down three examples for each type of arthropod.

- exoskeleton
- segmented² body
- two antennae
- many legs

- hard exoskeleton
- most have eight legs
- most have two claws
- four antennae

Look at the different groups of arthropods. What do they have in common?
