

THE INVENTION OF VARIABLE-PITCH PROPELLERS

Words

Look for the following words as you read the passage. Match each word with its correct definition.

Words

1. aviation
2. blade
3. coarse
4. confer
5. cruise
6. curiosity
7. design
8. enthusiast
9. handle
10. inflexibility
11. isolation
12. pitch
13. prolonged
14. propeller
15. reliably
16. revolutionize¹
17. rotation
18. sustained
19. turbulence
20. variable

Definitions

- A. n., a person who is very interested in something
- B. n., a device that causes an airplane or boat to move
- C. v., to travel at a steady speed
- D. n., the development, design, and use of aircraft
- E. n., interest; need to know
- F. adj., rough; not smooth
- G. n., a plan for making something
- H. v., to manage; work well with
- I. n., strong, sudden movements in air
- J. adj., able to change
- K. n., inability to change
- L. v., to discuss, consult with somebody
- M. n., the condition of being alone or separated from others
- N. adj., continuing for a long time, often in a negative sense
- O. n., a thin, flat part of a machine
- P. n., turning motion
- Q. v., to change completely
- R. adv., dependably
- S. adj., having the ability to continue for a long time
- T. n., the angle or slope of something

¹BrE: revolutionise

Reading

The Invention of Variable Pitch Propellers

Until the late 1920s, airplane **propellers** were made of a single piece of wood attached at the center¹ to the driveshaft of the engine. The tilt of the **propeller**, that is, how flatly it faced the wind, was fixed, which meant planes flew as if they had only one gear. If the plane had a fine **propeller**, it traveled the entire time as if in first gear, working well on takeoff and landing but working inefficiently during **sustained** flight. If the plane had a thick, **coarse** propeller, it traveled the entire time as if in high gear, working efficiently during sustained flight, but making takeoffs and landings dangerous and **prolonged**. This **inflexibility** meant that commercial uses of such aircraft were limited because the planes could not carry heavy loads either safely or efficiently.

In 1922, Wallace Rupert Turnbull patented his latest invention, the **Variable-Pitch propeller**. His **propeller** in effect gave airplanes gears. The propeller's **blades** were separate from each other, attached at the drive-shaft in the center, and could be moved independently or together to chop the air at different angles. The **propellers** could be tilted at takeoff and landing to act as if in first gear, chopping less air with each **rotation**, and could be tilted when **cruising** to act as if in high gear, chopping more air with each rotation. With this **Variable-Pitch** propeller, planes could now take off and land more safely and **reliably**, carry varying weights, and **handle** greater variations in wind speed and **turbulence**.

Turnbull was born in New Brunswick in eastern Canada in 1876. He studied mechanical engineering at Cornell, then continued his post-graduate studies in Europe, and returned to work at the Edison labs in New Jersey. In 1902, just one year before the Wright brothers made their historic flight, Turnbull went back home, set up his own lab in a barn, and started running his own **aviation** experiments.

To begin, Turnbull needed a wind tunnel. He built a wind tunnel, the first in the world, out of packing materials. In it, he tested different designs for **propellers** and wings; his research is the basis for many of the successful designs still in use today. Alone in his barn, Turnbull **designed** and tested his **Variable-Pitch** propeller. It was tested successfully in flight in Borden, Ontario, on June 6, 1927.

Turnbull spent his life experimenting and **designing** for the new science of **aviation** in his barn in Rothesay. He sometimes **conferred** with fellow aviation **enthusiast** Alexander Graham Bell in Nova Scotia, but for the most part, he worked in **isolation**. Unlike most engineers, he chose not to work in a university laboratory or in a lab such as Edison's, where

¹ BrE: centre

he would have been supported by like-minded engineers and physicists. Instead, he spent his adult life in a barn he equipped himself. Depending only on his intelligence, **curiosity**, and work ethic, he **revolutionized** flight. He is honored² in Canada as a pioneer in **aviation** and a genius in the study of aerodynamics.

Answer the questions about **The Invention of Variable-Pitch Propellers**.

Questions 1-5

Do the following statements agree with the information in the reading passage?

Write

TRUE	if the statement agrees with the information.
FALSE	if the statement contradicts the information.
NOT GIVEN	if there is no information on this in the passage.

- _____ 1. A coarse propeller worked better during sustained flight than during landing.
- _____ 2. Variable-Pitch propellers caused problems because of their inflexibility.
- _____ 3. The blades of a Variable-Pitch propeller could be moved to different angles.
- _____ 4. A plane with a Variable-Pitch propeller was easier to handle in turbulence.
- _____ 5. Variable-Pitch propellers were expensive to manufacture.

²BrE: honoured

Questions 6-7

Choose the correct letter, **A**, **B**, **C**, or **D**.

6. Wallace Rupert Turnbull designed his Variable-Pitch propeller

- A** at Cornell University.
- B** in Canada.
- C** at the home of Alexander Graham Bell.
- D** in Edison's lab.

7. Turnbull preferred to work

- A** with other inventors.
- B** in a university lab.
- C** with like-minded engineers.
- D** in isolation.
