Volcanoes in the Canary Islands

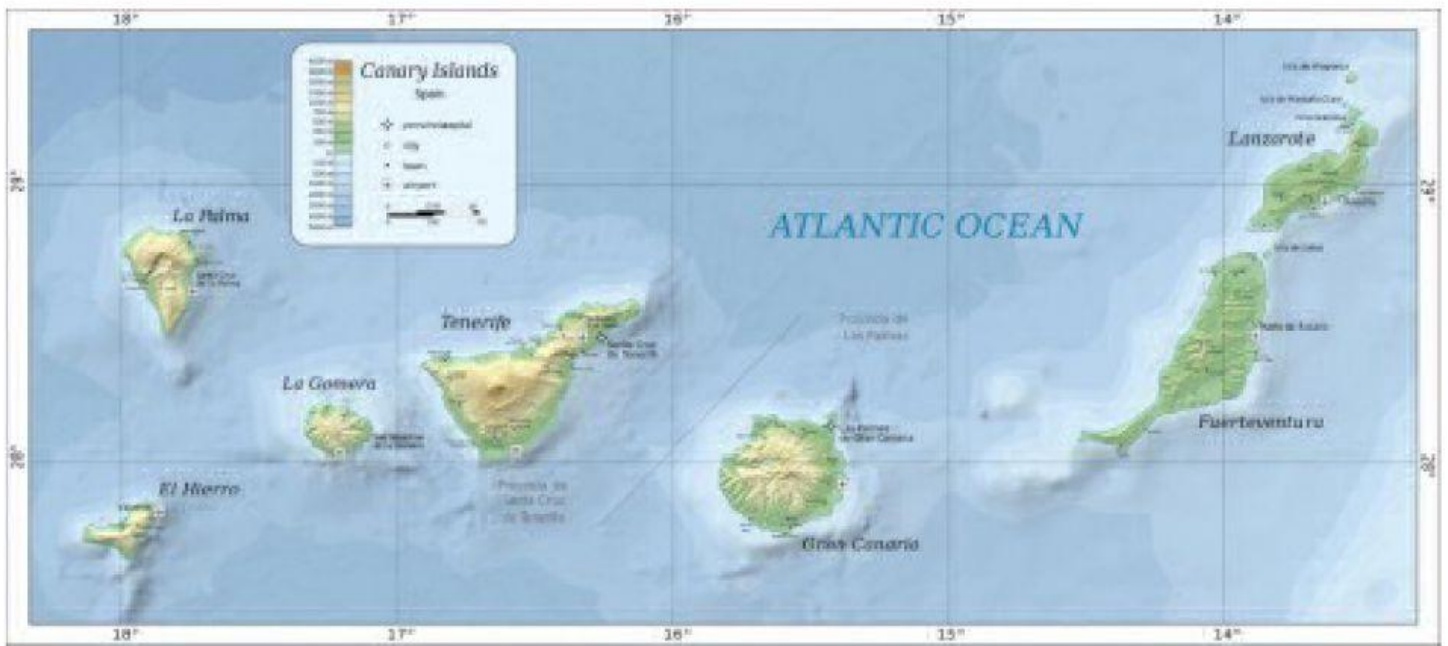

A volcano began erupting on Sunday in the Canary Islands, sending lava, smoke and ash into the surrounding area. The eruption has forced thousands of people from their homes. Scientists say the eruption could continue for weeks.

The Canary Islands are a group of islands which belong to Spain, but are located about 62 miles (100 kilometers) off the coast of Morocco. There are eight larger islands, which are popular with tourists, and many smaller ones.

The volcano that erupted is called Cumbre Vieja, in La Palma.

It erupted in 1949 and again in 1971.

The Canary Islands are a group of islands which belong to Spain. There are eight larger islands, and many smaller ones. La Palma, where the volcano erupted, is one of the smallest of the large islands.

- 1.- What is the name of the volcano?
- 2.- In what months was the eruption?
- 3.- In what island did the volcano erupt?
- 4.- ¿Qué expulsó el volcán?
- 5.- ¿Where are the Canary Islands?
- 6.- How many islands are there in the Canary Islands?
- 7.- In what island do you live?
- 8.- ¿Cuántas erupciones ha habido en La Palma en los últimos años y cuándo fueron?
