Better together

A Scientists have been investigating the effects of isolation – being separated from other people – on humans for many years and have come to some interesting conclusions.

- B** We might at times wish for a bit of time alone, but extended isolation clearly has a harmful impact on us. Loneliness or social isolation makes us less able to deal with stress, more likely to suffer from anxiety and low mood and perform worse on tasks that require thinking skills such as logic or memory. It also increases the risk of conditions such as dementia that affect people's ability to think and remember. A study by ELSA (English Longitudinal Study of Ageing) measured older people's spoken fluency and ability to remember. When they repeated the tests four years later, they found that people who took part in social activities and had more contact with others had declined noticeably less than lonely people.
- C** Isolation also affects our sense of time and can even cause us to imagine things. In one experiment, Maurizio Montalbini spent 366 days in a deep dark cave. By the end, he was sleeping 12 hours and was awake for 36 hours each 'day' and believed he had only been underground for 219 days. Another experiment at McGill University, Canada, had to finish early after participants became too distressed to continue. They had to spend time in small soundproof rooms, where they could see, hear or touch almost nothing. Just a few hours into the experiment, participants started talking or singing to themselves and many later became upset or anxious. Having hallucinations – seeing things like lights, shapes or animals that weren't actually there – was common. All performed worse on maths and word tests.
- D** What is interesting is that the effects aren't just on our mental health. The physical effects can include poorer sleep patterns, and lonely people are also more likely to get sick and have higher blood pressure. Research at Ohio State University, USA, has demonstrated that long-term social isolation can increase our chances of serious medical conditions such as heart disease and decrease brain function. Scientists were stunned by the results of brain scans of the nine members of a research team before and after they spent 14 months in the Antarctic, cut off from the rest of the world. Without exception, their brains had changed. Each member showed around a 7% decrease in a part of the brain that controls memory and learning. In addition, they had lower levels of a protein that manages stress levels.

- E** Those who spend long periods alone, such as solo mountain climbers or explorers, use a variety of strategies to deal with being cut off from others. For some, objects become human substitutes. One remarkable example of this is sailor Ellen MacArthur. In 2005, she spent over 71 days alone sailing over 44,000 km around the world and to combat the loneliness she called her boat 'Mobi'. It was as if she'd completed the journey with another person; all her emails were signed 'love e and mobi' and she used 'we' (referring to herself and Mobi) rather than 'I' in her description of events. Professor Gro Sandal, a Norwegian psychologist, found that for others the landscape itself becomes their companion. Looking at the incredible scenery around them made them feel more secure and less lonely. Others befriend animals or use physical activity. Sailor Bernard Moitessier did both. While taking part in a boat race around the world, he fed seabirds that followed his boat and did lots of yoga. Instead of completing the race, he discovered he was enjoying his isolation so much that he just kept on sailing, eventually going more than half way round the globe again.
- F** Actively using your brain helps reduce the negative effects of isolation. Another recent ELSA study measured people's verbal skills and ability to remember over ten years. It found that regularly taking part in cultural activities such as visiting art galleries or museums, going to concerts or the theatre helped people maintain their performance on the tests. Curiously, going to the cinema was not found to have the same benefits.

10 Match the paragraph descriptions (1–5) with paragraphs (B–F).

- 1 Two experiments that demonstrated different effects of isolation on our mental health. ____
- 2 Cultural activities that encourage us to think and challenge our brains make us feel less lonely. ____
- 3 Long periods of isolation have many negative effects, including affecting our memory. ____
- 4 Different ways people who spend time alone have found to deal with isolation. ____
- 5 How isolation can impact our body, including the brain. ____

Score: / 5
