- Do you know the man _____ is talking to Anne?
- The book _____ the student found in the library belonged to teacher Martin.

Reading Comprehension

Raymond Cattell, who was the first person in his family to attend college, invented personality tests while working at University College London. Cattell's aim was to use scientific methods to learn more about people's personalities. An ambitious go-getter, who was influenced by science fiction writer H. G. Wells, Cattell eventually went to work at Harvard. This is where he developed a series of tests to determine people's character traits.

But how reliable are they? Many tests claim to be highly scientific; however, people should be cautious about accepting their accuracy. Certain tests are more accurate, such as those designed with a specific purpose. For example, tests that help businesses hire the right candidate can be very helpful. But they are still only a part of the hiring process—likewise for choosing a career. For example, just because you're patient, logical, and intelligent, it doesn't mean you'll be a good scientist or mathematician. You might also need to be able to work on a team, and have a preference for scientific or number work. In brief, there are lots of other factors that need to be taken into consideration when deciding if a job is appropriate for you.

Some people argue that personality tests are extremely limited—they can only organize the information you put into them. They say that this doesn't make them very useful. For example, someone who is sweet and messy usually knows this information about themselves already. They don't need a test to tell them. Nonetheless, tests can be useful to help employers to get to know you better.

Instruction I: Choose the correct answer true or false.

- | | | |
|--|------|-------|
| 21. Cattell had worked at University College London before Harvard. | true | false |
| 22. Cattell developed the tests because of a science fiction book he read. | true | false |
