

The Supply Chain Process

esflow.com

Read the article and answer the questions.

The supply chain process begins with the sourcing and procurement of raw materials. These materials are then transported to the manufacturing facility, where they are received and stored.

When it is time to begin production, the materials are retrieved from storage and moved to the production area. Here, they are used in the manufacturing process to create products. Once the products are created, they are quality checked and then packaged.

The packaged products are then transported to warehouses, where they are received and stored. When orders are received from customers, the orders are retrieved from storage and prepared for shipping.

The orders are then shipped to the customers, who receive them. Then the customers use or consume the products. Customers may provide feedback on the products they have received.

orders are received from customers

materials are then transported to the manufacturing facility

sourcing and procurement of raw materials

materials are received and stored at manufacturing facility

customers use products

customers may provide feedback on the products

materials are retrieved from storage and moved to the production area

materials are used in the manufacturing process to create products.
