V. Reading

Lines	Some scientists say the chance of having identical quadruplets is only 1 in 13 million. Not if you're a nine-banded armadillo! These armadillo moms give birth up to 56 pups in their lifetime. And every time they give birth, they have four identical babies at a time. That means that an average armadillo has a record-
5	breaking fourteen sets of quadruplets. That's impossible for humans and very rare in the animal kingdom.
	Multiple births are very common in the animal kingdom. Often, this is because not all the babies survive. Cats usually give birth to 3-5 kittens, and some dogs have 5-10 puppies. These little brothers and sisters look alike, just like brothers
10	and sisters in human multiple births, but they are very rarely identical.
	Other animals rarely or never have multiple births. Usually, smaller animals have more babies and larger animals have fewer. Elephants have only one baby at a time. Whales almost always have only one baby at a time. These animals have a very different relationship with their offspring.
15	However, pigs are different. They are larger than other farm animals, but they have a lot of babies. Sometimes they have 20 piglets at a time!

Choose a or b for the correct answers based on the above passage.

21. Nine-banded armadillos always have
 - a. identical quadruplets.
 - b. fraternal quadruplets.
