3. My best friend lives **on / in** a small island.
4. Are there any bridges **on / in** your city?

V. **Read the text. Choose the correct option to complete the sentences.**

Wildlife Corridors

What happens to animals when we build cities in the middle of their homes? We build highways right through the animals' habitat—the area where they live. This causes many problems for animals. For example, deer may try to cross a busy highway in order to find food and shelter. Birds may not hear the call of other birds because of traffic noise.

The good news is that more cities are designing wildlife corridors. These corridors help animals go where they need to go in order to survive. A wildlife corridor connects one habitat to another. A corridor may be a bridge without cars over a busy highway or a body of water that provides a place for birds to migrate.

You can even plan a wildlife corridor in your own backyard. To create a corridor, simply plant flowers that attract birds and butterflies. This way they can safely travel from backyard to backyard.

1. Highways can make it difficult for birds and wildlife to _____.

☐ hear the call of other animals

☐ Build nests

☐ Find food and shelter

2. An example of a wildlife corridor is a _____.

☐ Body of water

☐ Bridge without cars

☐ highway

3. One way to create a wildlife corridor in your backyard is to _____.

☐ Construct a fence

☐ Build a bridge

☐ Plant a flower garden
