

HOW DO PLANTS MAKE THEIR OWN FOOD?

¿Cómo elaboran las plantas su propio alimento?

Plants make a process called:

PHOTOSYTHESIS

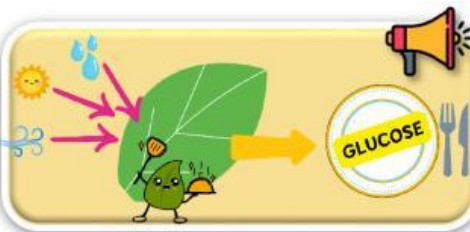

Photosynthesis is a process by which plants make their own food.

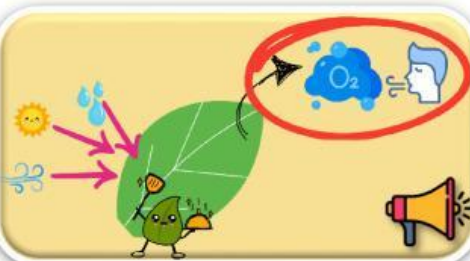

First, the roots absorb water and minerals.

Then, the stem transports the water and minerals around the plant.

After that, the leaves take in air, sunlight and water to make glucose, the plant's food.

Finally, the leaves release Oxygen into the air. We need this oxygen to breathe.
