

Climate Change

Find the missing words:

Climate change is a long-term shift in global or regional climate patterns, often seen as an increase in average global temperatures. This phenomenon is largely driven by human activities, especially the burning of (1) such as coal, oil, and gas, which release greenhouse gases like carbon dioxide into the atmosphere. These gases trap heat and cause the Earth's temperature to rise, leading to consequences like melting glaciers and rising (2) levels. Addressing climate change requires reducing greenhouse gas emissions and transitioning to (3) sources of energy, such as solar and wind power.
