

CELL TRANSPORT REVIEW

Cell transport – Movement of molecules in and out of the cell

Match the definition on the left with the term on the right.

1. _____ Large wastes or cell products are **released** from inside to outside a cell
2. _____ Diffusion of **water molecules** through a selectively permeable membrane.
3. _____ The transport of particles which **requires the use of energy**
4. _____ A state reached when particles continue to move but in *equal amounts* in and out of the cell.
5. _____ Large particles are surrounded by the membrane and **taken into the cell**.
6. _____ Movement of any particles from an area of **higher** concentration to one of **lower** concentration, with the concentration gradient.
7. _____ The transport of particles which **does not require energy**

- a. Passive transport
- b. Diffusion
- c. Dynamic equilibrium
- d. Exocytosis
- e. Osmosis
- f. Active transport
- g. Endocytosis

Circle the word or phrase that best completes the statement or answers the question.

8. The structure most responsible for maintaining cell homeostasis is the
cytoplasm **cell wall** **mitochondria** **plasma membrane**
9. The plasma membrane (cell membrane) is made up of a(n)
cholesterol layer **enzyme layer** **phospholipid bilayer** **protein layer**
10. Which of the following is NOT a form of passive transport?
facilitated diffusion **diffusion** **endocytosis** **osmosis**
11. Diffusion continues until
equilibrium is reached **turgor pressure is reached** **one side has more**
12. If a cell is placed in salt water, **water** leaves the cell by
osmosis **diffusion** **active transport** **phagocytosis**
13. A cell moves particles from a region of *low concentration* to a region of *high concentration* by
facilitated diffusion **osmosis** **passive transport** **active transport**

For each scenario, answer the questions and draw an **ARROW** to illustrate the movement of molecules.

14. Easter egg coloring:

A blue food coloring tablet is placed in a cup of vinegar and water. After several seconds, the blue tablet will begin to dissolve and will eventually spread evenly throughout the liquid.

- a. The blue dye is traveling from a _____ to a _____ concentration.
- b. Identify the type of transport illustrated in this scenario:
- c. Does this movement of particles require energy?

15. Following the digestion of food:

△ = glucose molecule

- Where is the higher concentration of glucose – blood or cell? _____
- Glucose travels through helper proteins in the cell membrane.
Identify this specific type of cell transport: _____
- Is this active or passive transport? _____
- Use an arrow to illustrate the movement of glucose molecules. _____

16. Movement of large particles *into* the cell:

- Identify the specific type of transport being illustrated: _____
- How are the molecules being moved?
_____ concentration → _____ concentration
- Does this require energy? _____

17. Movement of large particles *out* of the cell:

- Identify the specific type of transport being illustrated: _____
- Is this active or passive transport? _____
- What type of substances would be moved in this way? _____

18. For the boxes seen below, do the calculations (each environment must equal 100%), draw an **ARROW** to illustrate the direction of water movement. State whether the solution is *hypertonic*, *hypotonic*, or *isotonic*.

OSMOSIS

Water leaves cell.
Cell shrinks.
Hypertonic solution
