

## Classifying Changes: Physical vs. Chemical

When substances change, they can undergo physical or chemical changes. A physical change affects the form of a substance, but not its chemical composition. Examples include melting, freezing, and cutting. A chemical change involves a substance turning into a new substance, often with different properties. Examples include rusting, burning, and cooking.

**Fill in the Blank:** Fill in the blank with the correct words.

1. When ice melts, it undergoes a \_\_\_\_\_ change.
2. Burning wood in a fireplace is an example of a \_\_\_\_\_ change.
3. Dissolving sugar in water is a \_\_\_\_\_ change because the sugar can be recovered by evaporation.
4. A nail rusting over time shows a \_\_\_\_\_ change.
5. Chopping vegetables is considered a \_\_\_\_\_ change.

**Word bank:** chemical, physical, physical, chemical, physical

**Multiple Choice Questions:** Choose the correct answer from the choices for each question.

1. Which of the following is a chemical change?
  - ☐ A) Melting ice cream
  - ☐ B) Boiling water
  - ☐ C) Baking a cake
  - ☐ D) Shredding paper
2. What type of change is tearing a piece of paper?
  - ☐ A) Physical
  - ☐ B) Chemical
  - ☐ C) Biological
  - ☐ D) Nuclear
3. When vinegar and baking soda are mixed, they produce bubbles. This is an example of a:
  - ☐ A) Physical change
  - ☐ B) Chemical change

- ☐ C) Phase change
  - ☐ D) None of the above
4. Which change is reversible?
- ☐ A) Burning toast
  - ☐ B) Dissolving salt in water
  - ☐ C) Frying an egg
  - ☐ D) Rusting iron
5. Which of the following processes involves a physical change?
- ☐ A) Cooking pasta
  - ☐ B) Freezing a popsicle
  - ☐ C) Lighting a candle
  - ☐ D) Baking bread
