Adding and Subtracting Fractions with Different Denominators

$\frac{2}{3} + \frac{5}{6} + \frac{3}{4} = \frac{27}{12}$

Convert the fractions so that they have the same denominator by finding a common multiple of the denominators. Then, add or subtract the numerators.

1) $\frac{3}{8} - \frac{1}{5}$

$\frac{\square}{40} - \frac{\square}{40} = \frac{\square}{40}$

2) $\frac{7}{9} + \frac{4}{5} + \frac{2}{3}$

$\frac{\square}{45} + \frac{\square}{45} + \frac{\square}{45} = \frac{\square}{45}$

3) $\frac{15}{16} - \frac{7}{12}$

$\frac{\square}{\square} - \frac{\square}{\square} = \frac{\square}{\square}$

4) $\frac{6}{18} + \frac{11}{12} + \frac{4}{9}$

$\frac{\square}{\square} + \frac{\square}{\square} + \frac{\square}{\square} = \frac{\square}{\square}$

5) $\frac{5}{8} + \frac{7}{11} + \frac{3}{4}$

$\frac{\square}{\square} + \frac{\square}{\square} + \frac{\square}{\square} = \frac{\square}{\square}$

6) $\frac{13}{16} - \frac{6}{10}$

$\frac{\square}{\square} - \frac{\square}{\square} = \frac{\square}{\square}$
