Computer Hardware

Computers are made of different types of hardware that make it work. Some hardware that can be found in most computers are:

1. The **C.P.U** - is short for Central Processing Unit. This is the brain of the computer. It is where the computer takes the information that you give it and processes (thinks on) it. . It is an output device.

2. The **monitor** – is a screen that you see pictures, letters, or numbers. The computer uses it to show you information. It is an output device.

3. The **mouse** – is used to click, drag, or highlight information on the screen. It is an input device.

4. The **keyboard** – is the part of the computer where you type information like letters, numbers, or make commands (example, space). It is an input device.

LIVEWORKSHEETS

5. The **speakers/headphones**– plays sound or audio information like music, singing, or someone talking. It is an output device.

6. **Bank drive** – like a flash drive, external hard drive are tools we use to store information or put information that is on them into the computer. It is an input device.

OTHER HARDWARE

7. 

Projector
Output device

8. 

Scanner
Input device
