

Science-Effects of forces

Match the picture to the correct effect of a force that can be applied to it.

A stronger twist will cause it to spin very fast until it gradually comes to a stop.

The more harder you push it will go back and forth faster and at a higher position.

The harder you kick it will cause it to roll faster and go a longer distance.

The stronger you pull will cause it to reel in fast and it comes up closer to you.

The harder you pedal it will go faster and carry you a longer distance.
