

ICT Bullish Order Block Trading Guide

The **ICT Bullish Order Block (OB)** is one of the foundational concepts in **ICT Style** technical analysis. It highlights areas where buy orders concentrate, **triggering strong upward price movements**.

Traders can identify these zones and seize trading opportunities when the price revisits them.

What is an ICT Bullish Order Block?

A **Bullish Order Block** is a zone on the chart with substantial buying pressure, usually marking the starting point of a strong bullish surge.

An ICT Bullish OB typically consists of a bearish candle followed by a strong bullish engulfing candle.

How to Identify a Bullish Order Block?

A **Bullish Order Block (OB+)** is the last bearish candle before a bullish move, usually consisting of two candles (first bearish, second bullish).

To identify valid Bullish OBs, consider the following:

- ⚡ The bullish candle must Sweep the liquidity below the previous bearish candle
- ⚡ The bullish candle must close above the high of the bearish candle
- ⚡ Imbalances on lower timeframes validate the OB
- ⚡ Market Structure Shifts (MSS) on lower timeframes indicate OB's strength

How to Trade a Bullish Order Block?

To trade based with this strategy, follow these steps:

1. Identify the market's **Order Flow** or dominant trend
2. Confirm the validity of the Bullish OB
3. Wait for the price to revisit the OB
4. Use confirmation signals like **Market Structure Shifts (MSS)** on lower timeframes
5. Enter at around **50% of the OB zone** for optimal risk-to-reward ratio

In the example above, the market shifts structure towards buying, indicating bullish momentum.

Stop Loss and Take Profit in Bullish OB Trading

When trading based on a Bullish OB:

- ⚡ Place the **stop loss** a few pips below the OB zone
- ⚡ Use the next liquidity zones to determine your **Exit** point

Using Bullish OBs in Different Market Conditions

Bullish OBs are effective in trending markets and in ranging or neutral markets, where they can act as **reversal points**.

Precise market structure analysis and multiple timeframes are essential for identifying these zones under such conditions.
