

BATS

Sometimes, people mistake bats **for** birds, but they are not the same. They are the only mammals **(1)** can fly. Bats are found everywhere in the world. They are active **(2)** night and spend all day sleeping. They usually rest in dark places like caves, and some even rest **(3)** trees or rocks. They hang upside down **(4)** their feet while sleeping. Most bats eat flying insects. Some eat small animals such as birds, frogs, mice and fish. The largest bat cave in the world is in Bracken Cave, Texas. **(5)** summer, this cave can hold up to 20 million bats at once!
