**A- Developing electric vehicle Vs. developing fuel vehicle**

It's so important to develop technology in a great way, so that everyone can benefit from them. Some people believe that developing electric vehicles will open a door on electrical industries development. Others believe that since fuel vehicles are already existed and stronger than the electrical ones, the focus should be on developing them.

For those who has the adventure spirit, speed and power, then developing fuel cars is very important. But these vehicles contribute to pollution, climate change, and deplete natural resources like oil. On the other hand, electric vehicles are better for the environment because they produce zero emissions and rely on renewable energy sources.

Many of the people who are in the oil industry, confirm the abundance of fuel stations that can be easily reached. While it's a fact that there are so many fuel stations, but still the cost of fuel rising each day. Electrical cars are expensive and require more charging stations, but their benefits are much more. For example, lower operating costs and a cleaner planet, outweigh these concerns.

To sum up, it's clearly great to give attention, time and money to the development of electrical vehicles, because investing in electric vehicles is the best choice for a sustainable future, reducing pollution, and promoting greener technology for all.

counter-argument about the argument you don't support. (negative points) then argue (positive points about the argument you support)

Good points about both arguments

Opening sentence and presenting the two arguments
