

Week 30 Worksheet:

Name: _____

Date: _____

Part 1: Multiple-Choice Questions

Circle the correct letter for each question based on the assessment methods shown in the video.

1. When checking Capillary Refill Time (CRT) by pressing a finger onto the horse's gums, what is the normal time frame for the color to return from white back to pink?
 - A) Under 2 seconds
 - B) Exactly 5 seconds
 - C) Between 8 and 10 seconds
 - D) Over 12 seconds

2. Where should you place a stethoscope to accurately locate and listen to a horse's heartbeat?
 - A) High up on the horse's neck beneath the throatlatch
 - B) Deeply pushed way up into the horse's elbow area
 - C) Directly on top of the horse's hindquarters
 - D) Against the middle of the horse's barrel or flank

3. What is the correct mathematical method described to calculate a horse's total heart rate per minute?
 - A) Count the beats for 10 seconds and multiply by six
 - B) Count the beats for 20 seconds and multiply by three
 - C) Count the beats for 30 seconds and multiply by two
 - D) Count the beats for a full 60 seconds without multiplying

4. When calculating the respiration rate, how is a single breath counted?
 - A) Count only the inhalation (breathing in)
 - B) Count only the exhalation (breathing out)

- C) Count one complete inhalation and one complete exhalation together as one breath
 - D) Count every nostril flare over a two-minute period
5. Why does the video recommend counting respiration for 20 seconds (and multiplying by three) instead of counting for 30 seconds?
- A) Horses breathe much too fast to count for 30 seconds
 - B) It can be hard for a horse to stand still for 30 seconds without twitching or making you lose count
 - C) Digital timers only operate in 20-second blocks
 - D) Stethoscopes stop working after 20 seconds of breathing
-

Part 2: True or False Questions

Circle *TRUE* or *FALSE* for each statement based on the safety and execution steps in the video.

6. When taking a horse's temperature, you should stand directly behind their hind legs where it is easiest to reach.
- TRUE or FALSE
7. When inserting a digital thermometer, you should tilt it slightly to the side so it makes contact with the rectum wall rather than resting inside manure.
- TRUE or FALSE
8. A resting respiration rate of 16 breaths per minute is always perfectly safe and healthy for every single horse, regardless of what their individual baseline average is.
- TRUE or FALSE
