

Biodiversity in Ecosystems Test

Part I – Multiple Choice

Directions: Choose the best answer for each question.

- What is biodiversity?
 - The number of ecosystems in one area
 - The variety of living organisms in an area
 - The amount of rainfall in an ecosystem
 - The number of non-living factors in an ecosystem
- Which of the following contributes to biodiversity?
 - Variety of species
 - Variety of habitats
 - Genetic differences among organisms
 - All of the above
- What is a **species**?
 - A group of organisms that are similar and can reproduce with one another
 - All organisms living in an ecosystem
 - A group of different ecosystems
 - A non-living part of an environment
- Why is biodiversity important to an ecosystem?
 - It makes ecosystems less stable.
 - It helps ecosystems remain healthy and resilient.
 - It prevents organisms from interacting.
 - It eliminates competition.
- Which ecosystem would most likely have high biodiversity?
 - A tropical rainforest
 - A parking lot
 - A small area containing only one plant species
 - A frozen patch of ice with no living organisms
- What is **species diversity**?
 - The number of non-living factors in an ecosystem
 - The amount of sunlight an ecosystem receives
 - The number of habitats on Earth
 - The variety of species living in an ecosystem
- What is **genetic diversity**?
 - Differences in genes among individuals of the same species
 - Differences between ecosystems
 - The number of species in an ecosystem
 - The number of predators in an ecosystem
- What is **ecosystem diversity**?
 - The number of genes in one organism
 - The number of individuals in one species
 - The variety of ecosystems in a region or on Earth
 - The number of predators in an ecosystem
- Which of the following is a major threat to biodiversity?
 - Habitat destruction
 - Conservation
 - Recycling
 - Reforestation
- How can habitat destruction affect biodiversity?
 - It can reduce the # of species that can survive in an area.
 - It always increases biodiversity.
 - It has no effect on organisms.
 - It creates unlimited resources.
- Which human activity can contribute to habitat destruction?
 - Deforestation
 - Planting native trees
 - Creating wildlife preserves
 - Recycling materials
- What is an **endangered species**?
 - A species that is very common
 - A species at risk of becoming extinct
 - A species that has already become extinct
 - A species that lives only in water
- What does **extinction** mean?
 - A species becomes more common.
 - A species moves to another habitat.
 - A species no longer exists anywhere on Earth.
 - A species develops a new adaptation.
- Which of the following can help protect biodiversity?
 - Establishing protected areas
 - Destroying habitats
 - Increasing pollution
 - Introducing invasive species
- What is an **invasive species**?
 - A native species that is endangered
 - A non-native organism that can harm an ecosystem
 - A species that has become extinct
 - A species that only lives in a protected area
- Why can invasive species be harmful?
 - They may compete with native species for resources.
 - They always increase the number of native species.
 - They eliminate all predators.
 - They cannot reproduce.
- How can pollution affect biodiversity?
 - It always increases biodiversity.
 - It can damage habitats and harm organisms.
 - It has no effect on ecosystems.
 - It guarantees that species will survive.
- What is **conservation**?
 - The destruction of habitats
 - The removal of all predators
 - The protection and careful management of natural resources and ecosystems
 - The introduction of invasive species
- Why are genetic differences within a species important?
 - They can help populations adapt to changing environmental conditions.
 - They prevent organisms from reproducing.
 - They eliminate natural selection.
 - They make all organisms identical.
- Which action would BEST help maintain biodiversity?
 - Destroying forests
 - Overhunting wildlife
 - Introducing non-native species into new environments
 - Protecting habitats and reducing pollution

Part II – True or False - Directions: Write **T** or **F**

- 21. ____ Biodiversity refers to the variety of life in an area.
- 22. ____ Biodiversity includes genetic diversity, species diversity, and ecosystem diversity.
- 23. ____ An ecosystem with only one species has very high species diversity.
- 24. ____ Habitat destruction can cause a decrease in biodiversity.
- 25. ____ Extinction occurs when a species no longer exists anywhere on Earth.
- 26. ____ All ecosystems have exactly the same level of biodiversity.
- 27. ____ Genetic diversity can help a species adapt to environmental changes.
- 28. ____ Invasive species can negatively affect native species.
- 29. ____ Conservation efforts can help protect biodiversity.
- 30. ____ Pollution can be a threat to biodiversity.

Part III – Matching

Directions: Match each term in Column A with the correct definition in Column B.

Column A

Column B

- | | |
|------------------------------|---|
| 31. ____ Biodiversity | A. A species that is at risk of becoming extinct |
| 32. ____ Species diversity | B. The variety of species in an ecosystem or area |
| 33. ____ Genetic diversity | C. The variety of genes and inherited traits within a species |
| 34. ____ Ecosystem diversity | D. The protection and responsible management of natural resources |
| 35. ____ Endangered species | E. The variety of ecosystems in a region or on Earth |
| 36. ____ Extinction | F. The variety of living organisms in an area |
| 37. ____ Conservation | G. A non-native species that can cause harm to an ecosystem |
| 38. ____ Invasive species | H. The destruction or alteration of an organism's natural home |
| 39. ____ Habitat destruction | I. A community of organisms interacting with one another & with their Environment |
| 40. ____ Ecosystem | J. The permanent disappearance of a species from Earth |

Part IV – Fill in the Blank

Directions: Use the word bank to complete each sentence.

<u>Word Bank</u>								
biodiversity		conservation		extinction		habitat		endangered
invasive		genetic		species		ecosystem		pollution

- 41. The variety of life found in an area is called _____.
- 42. Differences in inherited traits among individuals of the same species are called _____ diversity.

43. A group of organisms that can reproduce with one another is called a _____.
44. A species that is at risk of becoming extinct is considered _____.
45. The permanent disappearance of a species is called _____.
46. An organism introduced into an area where it is not native & can cause harm is called an _____ species.
47. The place where an organism normally lives is its _____.
48. The protection and responsible use of natural resources is called _____.
49. Harmful substances released into the environment are forms of _____.
50. A community of organisms interacting with each other and with their physical environment is an _____.
-
