

SIGHT

1. Match the parts of the eye and their definitions.

iris

It transforms the light that enters into nerve signals.

retina

It's the black circle in the middle of the iris. Light enters the eye from this part .

pupil

It's the coloured circle at the front of the eye. It can be green, brown or blue.

2. Complete the definitions dragging the words from the box.

eyelashes

lacrimal glands

eyebrows

eyelids

- a) _____ spread the moisture from tears over the surface of the eye. They protect the eye from the excess of light.
- b) _____ produce tears that keep the eye moist and clean.
- c) _____ are short and curved hairs that prevent dust and sweat from entering the eyes.
- d) _____ are two strips of hair that prevent dust and sweat from entering the eyes.
