The AI process

The AI process used to create an image classification model that can be used in an autonomous car. The four steps, which you learned in previous terms, are listed below.

1. Data collection

2. Data representation

3. Training

4. Testing

Data Collection
- Collect the input data (images).

Data Representation
- Prepare the data
- Create the dataset.

Training
- Use the ML algorithm to train the model.

Testing
- Use the ML model performance.
